

CONFIDENTIAL COMMERCIAL PROPOSAL

Managed Hosted LipiCore Enterprise Document Intelligence Platform

Proposal to Sanima Bank

Prepared for	Sanima Bank	Product	LipiCore Enterprise Document Intelligence Platform
Prepared by	Lipi One Pvt. Ltd.	Proposal date	May 21, 2026
Hosting and server	Silver Lining	Validity	30 days from proposal date

Commercial structure

One-time setup fee, separate monthly hosting/server charge through Silver Lining, and separate monthly LipiCore software license and support charge through Lipi One Pvt. Ltd.

This proposal is prepared for discussion, evaluation, procurement review, and commercial finalization. Final pricing and service commitments are subject to agreed usage sizing, storage requirements, support level, and contractual terms.

1. Executive Summary

Lipi One Pvt. Ltd. proposes to provide Sanima Bank with the LipiCore Enterprise Document Intelligence Platform as a managed hosted service delivered through dedicated Windows and macOS desktop software. The platform is designed for banking teams that need secure document analysis, policy search, compliance review, internal knowledge assistance, and AI-supported document workflows without relying on public AI services for confidential banking material.

The solution will be hosted on server infrastructure provided and managed through Silver Lining. Lipi One Pvt. Ltd. will provide the LipiCore software platform, desktop client packaging, implementation, configuration, support, and ongoing maintenance. Sanima Bank will receive a secured bank environment with role-based access, document upload and indexing, AI chat over approved documents, source citations, activity logging, analytics, administrative controls, and the internal staff chat module included as a bonus.

Recommended approach

Adopt the Standard hosted package for a 1,000-2,000 user production rollout, with final capacity confirmed after user count, expected monthly query volume, document volume, OCR needs, storage volume, and support requirements are reviewed.

2. Understanding of Sanima Bank's Requirement

The bank requires a full proposal covering platform capability, commercial terms, pricing, implementation scope, responsibilities, timeline, support model, security controls, acceptance criteria, exclusions, and next steps.

- Securely upload, process, search, and analyze internal banking documents.
- Ask natural language questions over policies, circulars, reports, manuals, SOPs, and operational documents.
- Receive source-grounded AI answers with document references and citations.
- Maintain audit records for user activity, uploads, queries, and assistant responses.
- Apply role-based access for administrators, bank admins, and staff users.
- Use a managed hosted environment without Sanima Bank needing to operate AI servers or model infrastructure.
- Deploy staff access through approved Windows and macOS desktop software rather than a general webapp workflow.
- Include internal staff chat as a bonus module for bank-scoped communication.
- Apply additional storage pricing transparently at NPR 10,000 per TB per month where required.
- Separate commercial charges for setup, hosting/server, and LipiCore software license/support.

3. Proposed Solution

LipiCore Enterprise Document Intelligence Platform will be deployed as a secure managed hosted service. Sanima Bank users will access the platform through LipiCore Desktop software for Windows and macOS, connected only to the approved hosted LipiCore environment. This provides the bank with a controlled application surface instead of ordinary browser access, while keeping the backend services, documents, database, vector index, queues, and model runtime in the managed hosted environment.

The system uses retrieval-augmented generation. Documents are uploaded, stored, parsed, embedded, indexed, and searched through a bank-partitioned retrieval pipeline. When a user asks a question, LipiCore retrieves relevant document context, sends that context to the private model runtime, and returns a response with source references where available. AI output is positioned as staff assistance and must remain subject to authorized bank review for regulatory, credit, legal, customer-facing, or final decision use.

Core Capabilities

- Secure document upload and enterprise document library.
- Windows and macOS desktop software access.
- AI chat over uploaded documents and approved knowledge sources.
- Queued long-document analysis for large PDFs, scanned documents, and Excel workbooks.
- Session-bound document isolation for temporary analysis.
- Bank-level data partitioning for hosted environments.
- Source citations, source passage review, and document attribution for generated answers.
- Document lifecycle controls for draft, approved, superseded, archived, and disabled documents.
- Hybrid retrieval with vector search, keyword search, reranking, and citation verification.
- RAG evaluation tools for testing answer quality on agreed document sets.
- Audit logs for governance and internal review.
- Role-based access control and user management.
- Dashboard, analytics, activity, document, and administrative views.
- Private model execution on managed infrastructure.
- Configurable fast and deep AI response modes, subject to selected package capacity.

4. Deployment and Hosting Model

The platform will be hosted on Silver Lining server infrastructure and operated as a managed service for Sanima Bank. Sanima Bank users will access the system through the LipiCore Desktop client for Windows and macOS over HTTPS. Lipi One Pvt. Ltd. will configure and maintain the LipiCore platform layer, while the hosting/server component will be commercially separated for procurement clarity.

Hosted Stack

- LipiCore Desktop client interface.
- Python FastAPI backend.
- PostgreSQL database.
- Qdrant vector database.
- MinIO object storage.
- Redis queue and admission control.
- vLLM/private model runtime.
- Nginx reverse proxy with HTTPS/TLS.
- Monitoring, backups, and operational tooling.

Data Isolation

Each bank environment is logically isolated using bank-level partitioning across application records, vector search metadata, document records, and audit data. Documents uploaded for Sanima Bank will not be visible to other bank environments. Where required by the final package and contract, Sanima Bank may be assigned dedicated server capacity.

Desktop Access Security

- Dedicated Windows and macOS desktop software access instead of a general browser workflow.
- Desktop client connects only to approved LipiCore HTTPS origins.
- Backend authorization remains the source of truth for documents, uploads, downloads, chat, and user permissions.
- Desktop app lock behavior hides visible content and clears local web session storage.
- Unknown app-window navigations are blocked or opened externally rather than loaded inside the LipiCore window.
- Bank documents and AI data remain inside the managed hosted environment, not on staff machines.

5. Scope of Work

Phase	Lipi One / Silver Lining Responsibilities	Sanima Bank Responsibilities
1. Initiation	Kickoff, requirements confirmation, deployment plan, UAT criteria, role design.	Nominate project owner, technical coordinator, UAT users, and document owners.
2. Hosted setup	Provision managed environment, configure HTTPS, backend services, storage, database, model runtime, monitoring, backups.	Confirm access preference, domain/subdomain requirements, and security contacts.
3. Application configuration	Configure tenant, roles, branding, document categories, audit views, and AI routing.	Provide role matrix, user list, and document category structure.
4. Initial onboarding	Upload and index initial documents, validate retrieval, citations, parsing, and response behavior.	Provide sample and initial production documents approved for onboarding.
5. Training and UAT	Train administrators and staff users, support UAT, resolve go-live blockers.	Complete UAT within agreed timeline and sign off go-live readiness.
6. Go-live and support	Move environment to production, monitor early usage, provide support and health checks.	Coordinate production communication and user adoption.

Initial onboarding includes up to 10 GB of documents or 1,000 files, whichever comes first. Additional migration, scanned document processing, large historical archives, or manual cleanup can be quoted separately.

6. Functional Scope

Module	Included Scope
Secure Login	Authentication, session handling, password security, and authenticated API access.
Desktop Software Access	Windows and macOS LipiCore Desktop client connected to approved hosted LipiCore origins.
User Management	Administrator, bank admin, and staff user roles.
Document Library	Upload, organize, process, lifecycle-manage, and search bank documents.
Approved Knowledge Q&A;	Ask questions over approved documents with source references and citations where available.
Queued Long-Document Analysis	Background processing for large PDFs, OCR-heavy files, and detailed Excel workbook review.
Internal Chat (Bonus)	Bank-scoped staff messenger module included as a bonus module and kept separate from AI/RAG context.
Session Uploads	Upload temporary documents into a chat session for isolated analysis.
Source Evidence	Assistant answers include source document references and passage evidence where available.
RAG Evaluation	Evaluation center for testing retrieval and answer quality on agreed question sets.
Audit Logs	Activity records for uploads, queries, users, and assistant responses.
Analytics Dashboard	Usage, document, and activity-level reporting.
Compliance Support	Policy comparison, document review, and risk analysis assistance.
Model Modes	Fast response and deeper analysis modes, subject to package capacity.

Supported File Types

- PDF
- DOCX
- XLSX/XLS
- PPTX
- TXT
- CSV
- Image-based documents where OCR is enabled and document quality permits

7. Security and Compliance Controls

- HTTPS/TLS encrypted access.
- Windows and macOS desktop client access instead of general browser-based usage.
- Approved LipiCore origin restrictions inside the desktop client.
- Desktop app lock behavior with local session clearing.
- Bank-level data isolation.
- Session-level document isolation.
- Role-based access control.
- Password hashing using bcrypt.
- JWT-based authenticated API access.
- Prompt guardrails for document-grounded responses.
- Source verification and retrieval evaluation controls for reducing unsupported answers.
- Document lifecycle states to control approved, superseded, archived, and disabled content.
- PII masking controls for sensitive information.
- Audit logging for major system activity.
- Internal messenger data is kept separate from AI document chat and is not embedded into the RAG index by default.
- Restricted operational access to hosted infrastructure.
- Database, object storage, and vector store access controlled through backend services.

Data Use Commitment

- Sanima Bank documents remain within the managed hosted environment.
- Sanima Bank documents are not used to train public AI models.
- Sanima Bank data is not shared with other banks or third parties except where explicitly approved by the bank.
- On termination, bank data can be exported and removed according to the agreed retention and exit process.

Compliance note

LipiCore provides controls that support banking governance, auditability, and internal compliance. Final regulatory approval, internal policy approval, and third-party certification requirements remain the responsibility of Sanima Bank unless separately contracted.

8. Implementation Timeline

The standard implementation timeline is 4 to 6 weeks from purchase order and receipt of required Sanima Bank inputs. Timeline depends on document volume, bank-side approvals, integration needs, and UAT response time.

Phase	Duration	Output
Kickoff and requirements	3-5 business days	Confirmed scope, project plan, roles, and access requirements
Environment provisioning	5-7 business days	Hosted Sanima Bank environment ready
Configuration and documents	5-10 business days	Tenant configured and initial documents indexed
Training and UAT	5-10 business days	Users trained and UAT completed
Go-live	2-3 business days	Production access and go-live support

9. Deliverables

- Hosted production environment for Sanima Bank.
- Windows and macOS LipiCore Desktop access package.
- Configured Sanima Bank tenant and administrator accounts.
- Role-based user access structure.
- Document library and AI assistant modules.
- Internal chat system bonus module.
- Initial document ingestion as defined in scope.
- Audit logging and analytics views.
- Administrator and staff training.
- User handover material.
- Production go-live support.
- Monthly support and maintenance under the selected subscription plan.

10. Pricing

Pricing is separated into one-time setup, monthly hosting/server, and monthly software license/support charges. All prices below are indicative in NPR and exclusive of applicable VAT, taxes, withholding, bank charges, and government duties. Final pricing will be confirmed after usage sizing, storage requirements, support level, and server capacity are finalized.

Package	One-Time Setup	Monthly Hosting / Server	Monthly Software License + Support	Total Monthly
Starter	NPR 500,000	NPR 175,000	NPR 225,000	NPR 400,000
Standard	NPR 800,000	NPR 350,000	NPR 450,000	NPR 800,000
Enterprise	NPR 1,500,000	NPR 750,000	NPR 850,000	NPR 1,600,000

Package	Recommended For	Included Capacity
Starter	Department or focused bank rollout	200-500 users, standard managed capacity, business-hours support
Standard	Bank-wide production use	1,000-2,000 users, stronger managed capacity, priority queue during business hours
Enterprise	High-volume institution-wide deployment	3,000-5,000 users, dedicated managed capacity, priority support and escalation

Storage	Pricing
Included storage	Confirmed during final package sizing based on document volume and retention requirement.
Additional storage	NPR 10,000 per TB per month beyond the agreed included allocation.

Market Comparison and Tradeoffs

Public ChatGPT and Claude prices are useful benchmarks, but they are not direct substitutes for LipiCore. ChatGPT Business and Claude Team are general-purpose AI workspaces. LipiCore is a managed banking document intelligence platform with hosted infrastructure, document ingestion, retrieval, source citations, role-based access, audit records, internal staff chat, and support included in one package.

Package	User Band	Total Monthly	Effective Cost / User / Month
Starter	200-500 users	NPR 400,000	NPR 2,000 to NPR 800
Standard	1,000-2,000 users	NPR 800,000	NPR 800 to NPR 400
Enterprise	3,000-5,000 users	NPR 1,600,000	NPR 533 to NPR 320

User Count	ChatGPT / Claude @ USD 25/User/Month	Approx. NPR / Month
500 users	USD 12,500/month	Approx. NPR 19.2 lakh/month
2,000 users	USD 50,000/month	Approx. NPR 76.8 lakh/month
5,000 users	USD 125,000/month	Approx. NPR 1.92 crore/month

For reference, these comparisons use an indicative USD/NPR rate of approximately NPR 154 per USD. Actual foreign exchange, taxes, procurement terms, data residency, enterprise contract terms, and usage limits may vary.

Option	Indicative Public Cost	What It Includes	Bank Tradeoff
LipiCore Standard	NPR 800,000/month for 1,000-2,000 users	Windows/macOS desktop client, hosted banking document platform, RAG, audit logs, RBAC, internal chat, support, and managed infrastructure.	Purpose-built for bank document intelligence; model choice and capacity are managed by Lipi One/Silver Lining.
ChatGPT Business	USD 25/user/month monthly or USD 20/user/month annual equivalent	General ChatGPT workspace with admin controls and business privacy terms.	Seat cost scales linearly; API usage, custom RAG, bank document platform, hosting, and custom audit workflows are separate.
Claude Team	USD 25/user/month monthly or USD 20/user/month annual equivalent for standard seats; Team is listed for 5-150 users.	General Claude team workspace with connectors and administration features.	Larger banks need Enterprise; enterprise use may combine seat price and API usage. Banking-specific platform still needs to be built.
DIY API Build	Token usage varies by model and workload; GPT-5.4/Sonnet-class models can become material at high document volume.	Access to frontier model APIs.	Bank must still build and operate document ingestion, vector search, citations, RBAC, audit logs, security review, support, and hosting.

Market pricing references: OpenAI ChatGPT Business public pricing, OpenAI API pricing, Anthropic Claude pricing, and public USD/NPR exchange-rate sources as of May 2026.

What the One-Time Setup Fee Covers

- Project kickoff and requirements confirmation.
- Hosted environment provisioning.
- Sanima Bank tenant setup.
- Security and access configuration.
- Initial admin/user role configuration.
- Initial document onboarding up to 10 GB or 1,000 files.
- UAT support.
- One administrator training session.
- One staff training session.
- Go-live support.

What the Monthly Hosting / Server Charge Covers

- Managed server compute provided through Silver Lining.
- AI model runtime capacity.
- Storage allocation.
- Additional storage expansion at NPR 10,000 per TB per month where required.
- Database and vector database hosting.
- Object storage.
- Backup storage.
- Monitoring and operational maintenance.
- Network, TLS, and hosting operations.

What the Monthly Software License + Support Charge Covers

- LipiCore Enterprise Document Intelligence Platform software license.
- Windows and macOS LipiCore Desktop software access.
- AI document analysis modules.
- RAG retrieval, source citation, and audit logging features.
- User management and role-based access control.
- Product maintenance updates.
- Security patches.
- Helpdesk and technical support under the selected support plan.

Internal Chat System Bonus Module

Lipi One Pvt. Ltd. will include the internal chat system as a bonus module with the hosted LipiCore package for Sanima Bank. The internal chat system is separate from the AI document chat. It is intended for staff-to-staff communication inside the LipiCore environment, so teams can coordinate around document review, compliance queries, operational follow-ups, and internal decisions without leaving the secured platform.

Messenger boundary

The internal chat system is a communication module, not an AI training source. Chat messages and shared files are not embedded into the document intelligence index, not used as AI context, and not used to train public AI models unless a future written scope explicitly changes that boundary.

Feature	Included Detail
Direct messages	Secure one-to-one staff conversations inside the Sanima Bank LipiCore environment.
Department channels	Automatic or configured channels for departments such as compliance, credit, operations, risk, audit, and administration.
Custom groups	Project, branch, committee, and working-group conversations for internal coordination.
Announcements	Controlled announcement channels for bank-wide or department-level notices.
File and image sharing	Secure sharing of internal files and images inside messenger, subject to retention and attachment policy.
Unread and read status	Unread counters, delivery status, and read status for practical staff follow-up.
Bank-scoped directory	Users are drawn from the configured Sanima Bank user base and remain isolated from other tenants.
Searchable history	Local keyword search over permitted conversations for follow-up and continuity.
Audit and retention	Administrative audit events, retention policy, and attachment policy support for governance.
Commercial treatment	Included at no additional software license charge within the selected hosted package.

11. Payment Terms

- One-time setup fee: 50% upon purchase order and 50% before production go-live.
- Monthly hosting/server charge: billed monthly in advance.
- Monthly software subscription: billed monthly in advance.
- Minimum contract term: 12 months.
- Taxes: VAT and applicable taxes charged separately.
- Price validity: 30 days from proposal date.
- Annual prepayment discounts can be discussed for bank procurement preference.

12. Support and SLA

Support Level	Applies To	Coverage
Standard Support	Starter	Email and remote support, business-hours support window, 4 business-hour critical acknowledgement, monthly health check, security and software patches.
Priority Queue	Standard	Business-hours support with priority queue over Starter, critical acknowledgement target agreed in final support schedule, monthly health check, security and software patches.
Priority Support	Enterprise or upgrade	Priority remote support, extended support window, 1-hour critical acknowledgement target where commercially agreed, dedicated escalation contact, quarterly service review.

Package	Availability Target
Starter	Pilot availability target defined after infrastructure review
Standard	Department availability target defined after infrastructure review
Enterprise	HA/SLA target available only with agreed whole-bank HA architecture

Formal SLA commitments depend on final infrastructure, monitoring, backup and restore procedure, failover design, support terms, and successful operational drills. Availability excludes planned maintenance, bank network issues, force majeure, third-party internet disruption, and bank-side access problems.

13. Acceptance Criteria

- Sanima Bank can securely log in to the hosted environment.
- Admin users can create and manage bank users.
- Users can upload supported documents.
- Uploaded documents can be processed and queried.
- AI responses show source references where source documents are available.
- Role-based permissions work according to agreed configuration.
- Audit logs capture key user and system activity.
- Representative queued long-document analysis jobs complete successfully on agreed sample files.
- Windows and macOS desktop access packages connect only to approved LipiCore hosted origins.
- Internal chat module supports direct messages, group/channel conversations, and administrative user control.
- Training has been completed.
- UAT issues classified as go-live blockers have been resolved or formally deferred.

14. Sanima Bank Responsibilities

- Nominate project owner and decision maker.
- Nominate technical/security contact.
- Provide user list and role matrix.
- Provide sample and initial production documents.
- Review configuration and UAT findings on time.
- Provide internal approvals for staff access and production use.
- Complete required compliance review and procurement approvals.
- Provide bank-owned domain/subdomain or access preference, if required.

15. Exclusions

- On-premise hardware procurement for Sanima Bank.
- Core banking system integration unless separately contracted.
- DMS, SharePoint, email, or intranet integration unless separately contracted.
- Custom AI model fine-tuning.
- Full document digitization or manual data cleanup.
- Large-scale historical document migration beyond included limits.
- Unlimited heavy OCR, PDF, or Excel processing without additional capacity sizing.
- Perfect OCR, handwriting, seal, signature, or complex-table verification.
- Automatic credit, risk, legal, regulatory, or customer decisions without authorized bank review.
- Using internal messenger messages as AI/RAG context unless separately scoped and approved in writing.
- Legal, regulatory, or audit certification.
- Third-party VAPT charges.
- Bank-side network, device, or endpoint management.
- Custom workflows not listed in the agreed scope.

16. Assumptions

- Sanima Bank will use the hosted LipiCore environment operated by Lipi One Pvt. Ltd. and hosted through Silver Lining infrastructure.
- The selected package will be sized before final contract signing.
- Documents provided by Sanima Bank are legally permitted to be processed in the hosted environment.
- Sanima Bank will appoint users for UAT within the agreed project timeline.
- AI output is an assistance tool and does not replace authorized bank decision-making.
- Queued long-document analysis turnaround depends on document quality, OCR requirement, worker capacity, model queue load, and selected package sizing.
- Desktop software does not run the backend, database, vector database, object store, RAG pipeline, or model services locally.
- Sanima Bank will validate AI-assisted outputs before using them for final regulatory, credit, legal, or customer-facing decisions.

17. Change Management

Any work outside the agreed scope will be handled through a written change request. Each change request will include scope, effort, timeline, and commercial impact before execution.

- New modules or workflows.
- Additional integrations.
- Higher storage or AI capacity.
- Custom approval flows.
- New report formats.
- Additional training.
- Custom security architecture.

18. Termination and Exit

- Upon termination, subject to payment clearance and agreed data retention policies, Sanima Bank may request export of its documents and available system records.
- Lipi One Pvt. Ltd. will provide a reasonable data export in agreed format.
- Bank data will be deleted from active systems after the agreed retention period.
- Backup deletion will follow the backup retention schedule unless legally restricted.

19. Why LipiCore

- Banking-focused document intelligence workflows.
- Managed hosted model that separates hosting/server and software charges.
- Private model execution on controlled infrastructure.
- Document-grounded answers with source citations.
- Session and bank-level data isolation.
- Audit logs for governance.
- Lower operational burden for Sanima Bank compared with managing AI infrastructure internally.

20. Next Steps

- 1 Sanima Bank reviews the proposal and selects preferred package.
- 2 Lipi One Pvt. Ltd., Silver Lining, and Sanima Bank complete usage sizing.
- 3 Commercial terms and final scope are confirmed.
- 4 Purchase order or agreement is issued.
- 5 Project kickoff is scheduled.
- 6 Hosted environment is provisioned.
- 7 UAT and training are completed.
- 8 Production go-live begins.

Appendix A: Technical Overview

Component	Technology
Desktop client	LipiCore Desktop for Windows and macOS connected to hosted LipiCore services
Backend	Python FastAPI
Database	PostgreSQL
Vector database	Qdrant
Object storage	MinIO
Queue/admission control	Redis and RQ workers
AI runtime	vLLM/private LLM
Reverse proxy	Nginx with TLS
Retrieval	Hybrid vector and keyword search with reranking and source verification
Messenger	Separate internal chat service boundary; not part of AI/RAG context by default

- 1 User uploads documents.
- 2 Documents are stored securely.
- 3 Text is extracted and divided into searchable chunks.
- 4 Embeddings are created and stored in a vector database.
- 5 User questions are matched against relevant document chunks.
- 6 Hybrid retrieval and reranking prioritize relevant approved sources.
- 7 The AI model generates a response using retrieved context.
- 8 The response includes source references where applicable.
- 9 User actions and responses are logged for audit.

Appendix B: Department Use Cases

Department	Example Use Cases
Credit	Loan policy search, agreement review, collateral document checks
Compliance	Circular interpretation, policy comparison, audit evidence lookup
Operations	SOP lookup, internal process guidance, exception handling support
Risk	Risk policy review, portfolio documentation analysis
Legal	Contract clause search, document comparison, regulatory reference lookup
Internal Audit	Audit trail review, document evidence search, control testing support
HR/Admin	Policy FAQ, staff manual search, onboarding document support
